About the Cover
James Kretzschmar, AE7AX, describes how to display data on a liquid crystal display (LCD). A Texas Instruments MSP430G2553 microcontroller controls the Newhaven NHD-0216H1Z LCD 16 by 2 LCD with your custom programming. AE7AX discusses five commands in detail: (1) clear the display, (2) display control, (3) display shift, (4) entry mode, and (5) setting of the character position DDRAM address. One example program sets up the LCD to display the letters "QEX". Another example program provides a practical application using one of the analog-to-digital (ADC) channels on the MSP430G2553 microcontroller to sample a position sensor and display the digital number on the LCD.

In This Issue

2 Perspectives
Kazimierz "Kai" Siwiak, KE4PT

3 Controlling a 16x2 LCD with the Texas Instruments MSP430G2553 Microcontroller
James Kretzschmar, AE7AX

8 Bridging the Terahertz Gap at 30 THz
Andrew J. Anderson, VK3CV/WQ1S

13 NanoSSB RX — An Ultra Low Cost SSB Multiband Receiver
Dr. George R. Steber, WB9LVI

19 NanoVNA SMD Tweezers
Tom Aldredge, VA7TA

26 A Pulse Generator for Making TDR Measurements
Larry Lamano, WA8QZY

35 Self-Paced Essays — #8 Maximum Power Transfer Theorem
Eric P. Nichols, KL7AJ
